### MASTER'S THESIS

Concurrent monads are a type of monad that can be used to model parallel execution. We formalized them in Agda using categories parameterized by their object type. This makes expressing the interaction of Kleisli categories and their respective base categories much easier.

Alongside the formalization, we introduce two 2-categories. The internal monads of one are exactly concurrent monads while they do not admit an internal

resolution. The internal monads of the other are almost concurrent monads, for example their monoidality witnesses are an oplaxly natural transformations. But these almost concurrent monads admit internal resolutions.

## LANGUAGE KNOWLEDGE

|                  |             |
|------------------|-------------|
| <b>Icelandic</b> | native      |
| <b>English</b>   | near native |
| <b>German</b>    | fair        |

I'm interested in languages in general and have taken a couple of courses in Mandarin, one in Hindi and one in Menominee, an Algonquian language.
